AutoCAD Serial Key saves and loads most project files under the.DPROJ file extension (see below). AutoCAD Cracked Version can import and export files to various file types. The following table lists the different formats that AutoCAD supports for the import and export of data. The table also shows how these formats work within AutoCAD and in the other applications that import and export the data. When saving a drawing, there is a choice between saving under a DXF file, DWG file or PDF file. The DXF file format is the most compact file format and is recommended when importing the data. This allows importing of large amounts of data with a single file. DWG and PDF files are saved with variable-length data and require more disk space than the DXF format. The DXF file format allows only the content of the drawing to be saved. Each software-defined drafting (SDD) file is associated with a drawing object. This drawing object includes an AutoLISP structure and the geometric model of the drawing. The SDD file also includes the components, resources, annotations, datums, templates, procedures, sheets, and drawing text. The SDD files that are created with AutoCAD can be opened with AutoCAD only. Any other software is not able

to open the drawing. This restriction is removed when the drawing is opened with a different software. The AutoCAD 2007 DXF Standard format has four extensions. DXF 7.0 DXF 7.1 DXF 7.2 DXF 7.3 The first three extensions allow the following features to be saved in the file. DXF 7.0 supports the following features: DXF 7.0 adds the ability to store more complex information in the file, including: Project data (structures) Paper space definitions Hidden objects Camera definitions Dimensions and reference frames Label data Annotations Cutlines Automatic text Annotations Objects in the drawing Layers Extrusions Intersections Polygons Features Layers Trig points Lines Circles Ellipses Hyperbolas Spline curves Shaded surfaces Text DXF 7.1 supports the following features: DXF 7.1 adds the ability to store the following information in the drawing file: Dynamic lines (objects with an associated moving line) Dynamic arcs (objects with an associated arc) Dynamic circles

Possible Duplicate: What's the difference between loopback address, external and internal IP addresses? I'm trying to understand what the host IP address and the user IP address are, the best way to explain it is: A client connects to a server on port 80. The client sends a request to the server, and the server replies. The server sends the request back to the client. I'm guessing the server would be sending the request to the host IP address, and the client to the user IP address. Can someone please explain what the host IP address and the user IP address are, and how they are different? A: There's no such thing as a "host IP address" or "user IP address" per se. Those things are just imaginary constructs to make network things easier to talk about. The "host IP address" is an IP address associated with the host computer the service is running on. The "user IP address" is the IP address of the device actually making the request. For example, let's say you have a web server, which is running a service on port 80. Let's say your computer is associated with the IP address of 192.168.0.1, and you're making a request from the computer associated with 10.0.0.1. The host computer is 192.168.0.1, and the user computer is 10.0.0.1. The "host IP address" is 192.168.0.1, and the
