Editing allows the user to manipulate a drawing's elements. Objects, such as walls, fences, and rooms, can be removed, modified, and replaced, and can be placed at any point in the drawing. Line and polygon edges can be adjusted or rotated, and area, dimension and title text can be edited or changed. The drawing can be updated in the background to reflect the user's changes. A number of features provide editing tools that allow the user to perform complex tasks. One of these is the "Ghosting" or "Ghost Lines" feature. The Ghost Line tool allows the user to edit the edge of an existing line without affecting the original line's dimensions. In many cases, it is not necessary to delete a line to add or adjust its width. The Ghosting feature allows the user to remove excess line and add points without deleting the line. The new Markup Import and Markup Assist command is intended for use by those who rely on feedback or comments from clients, designers, and other people. The command is designed to import most common types of feedback, such as annotations, comments, and drawings that will be incorporated into your drawings. You can apply notes to a specific element, such as a wall, electrical fixture, door, or other CAD object, using the Markup Import command. You can also import files of feedback from PDFs, spreadsheets, and other types of document files, in addition to annotating directly in a printed copy of a drawing. You can annotate and comment on the same drawing, using the Markup Assist command. This is designed to save you time and reduce mistakes that can occur when annotating and commenting on separate documents. The command remembers the annotations that you apply with the Markup Import command. When you mark up a second drawing using the Markup Assist command, the annotations in the first drawing are applied to the second drawing automatically. You can then print out the first drawing and use it as a template for the second drawing. Thanks to visual feedback, you can see the difference that your changes make at the same time that you annotate. The imported marks stay on the object until you remove them with the MarkupRemove command. We've reorganized the Markup menus in the Edit and Preferences dialog boxes so that you can choose which types of marks you want to import. You can access the Markup Import/Markup Assist menus and the Markup Remove menu through the menu bar or context menu. New commands for text and illustration styles: The new Drawing Tool Options dialog box now contains an Illustration Styles menu with commands for setting the type of line style that you draw with a line tool. The new Text Styles dialog box now contains a Text Styles menu with commands for setting the type of text style that you use in your drawings. The Draw Type menu has been removed from the Tool Options dialog box, so you can no longer use the Draw Type menu to select whether you draw lines or text with the Line or Text tool. Use the new command New Style () to create new text styles or lines with styles that you've defined in your styles palette. The command inserts a new style box on the drawing area, along with the appropriate line style and text style. Use the New Style (Custom) command to create new custom styles.
