Glutamine Synthetase Glutamine Synthetase, Glutamine Synthase, Glutamine Synthase I Function: Glutamine Synthetase catalyzes the synthesis of glutamine from glutamate and ammonia. Glutamine is one of the most abundant amino acids in mammalian cells and is actively taken up by cells from the blood and used for various metabolic purposes. Clinical Significance: Glutamine Synthetase is the rate-limiting enzyme in the urea cycle. Glutamine Synthetase catalyzes the reaction between alpha-ketoglutarate and glutamine. When the body is in a nitrogen deficient state, glutamine synthetase requires more glutamate and alpha-ketoglutarate to synthesize glutamine. The enzyme is maximally active in the liver. In the cell, glutamine is converted back to glutamate for export or used to synthesize other amino acids. Cultivation: Glutamine synthetase is a good heterotrophic culture organism. With a pH of 7.0-7.5 and 1-2% dissolved oxygen. Glutamine synthetase is a fast growing organism and can be grown at from 25-35°C and from pH 6.5-8.5. Glutamine synthetase is also grown with a variety of organic and inorganic nitrogen sources. Glutamine synthetase should be added to a meat broth or protein concentrate. Glutamine synthetase is commonly found in meat bouillon, most U.S. processed meats and meat products, and some cheese products. It is also used as a nutritional supplement in animal feed. If glutamine synthetase is present in low amounts in a meat product or feed, a portion of the product can be removed prior to blending with other ingredients to avoid bitter taste issues. Applications: Glutamine Synthetase may be used as a supplement in parenteral nutrition.Strategies to improve outcomes in children with acute myeloid leukemia: An ongoing process.
