Photoshop is not a graphics package. It is a software package that allows you to edit, create, or manipulate digital images — that's all. If you need to create a photo collage, use Photoshop only as your starting point, and then use other programs to create the finished product. Getting Started with Photoshop To get started with Photoshop, simply download the software and install it on your computer. You can do this with your computer's operating system, or you can download it from Adobe's website and run the install program. Figure 16-1 shows a sample installation window. **Figure 16-1:** Don't be fooled by all the options — at the end of the day you just want to get started. Here's an explanation of the most basic Photoshop settings: Default settings: These settings are common across the various utilities in the Photoshop program. For example, if you click on a layer, you see a default setting of Linework, 20 Pixels. This means you can't increase the linework and then save as a New Photoshop file. If you do, it will result in a 20-pixel pattern fill, as shown in Figure 16-2. Smart Objects: You may know this as a tagging feature, which is a little complicated to explain. Smart objects help to keep your layered files organized so you can easily find and organize specific layers later. If you click on any particular layer (and you're in the Layers panel), a small red square appears above it, and you can drag that layer to either the Layers panel or to a group on the panel. Don't drag the Smart Objects onto the Layers panel unless you want to move the object into that layer, which changes the layer's properties. **Figure 16-2:** Edit linework as needed to create a pattern fill. If you want to keep your editing separate from the Layers panel, you can use a group of layers on the panel and a group on the image itself. When you create new files in Photoshop, you have the option to group layers together so you can easily access them if necessary. So, for example, if you use a group of layers to show the background, you can crop the background in the same group but keep the separate elements separate on a new document. Just about any layer is usable as a Smart Object. In fact, you can put the Smart Objects on a flattened file (or what Adobe

Chromium from the aqueous extract from the bark of Gymnolobium affine was determined by flame atomic absorption spectroscopy. The analytical method used was based on the reduction of $Cr(VI)$ by hydrazine in hydrochloric acid medium, followed by the stripping of the chromium using acetic acid. The results were compared with those obtained using atomic absorption spectrophotometry. The average recovery in the range of 3.0×10^{-5} to 1.0×10^{-4} M concentrations was 98.5%. The method was precise and accurate. The present study showed a positive correlation between the amount of chromium in the aqueous extract of Gymnolobium affine bark and the original concentrations in the extracts. The above findings should be taken into consideration in the treatment and administration of this medicine.Q: Is there any way to remove a nested document in a MongoDB collection if it's nested arrays have been replaced? According to a report from a CBS local affiliate, a medical records technician in Dallas was selling the names of patients without their consent. The hacker found the info while working at a Dallas hospital. According to police, from 2010 through 2012, the hacker entered into the My Health Choices database with the intent of obtaining health care information. In some cases, the hacker changed the name and birthdate of patients in the database. The hacker had access to about 2.5 million records. When the hospital told the police about the breach, the hacker deleted the database. The hospital did not state if the breach had any effect on the health care of any patients. "While a hack this large is rare, it's important to note that the My Health Choices system is used by some of the nation's largest health systems," Gary Winslow, a spokesperson for the Texas Health and Human Services Commission told CBS Dallas. The report stated that the hacker made more than $1 million from the sale of the database.Watchdog Warns Contractors, Engineers about Fraud Shepherd Publishing 11/24/2004 A recent peer-reviewed industry journal article has come to the defense of federal contractors working with the United States government in Iraq. It appears that the U.S. government doesn't consider the hundreds of thousands of dollars that are paid out in Iraq to these companies, to be the government's money. It is, instead, the contractors' money. One of the main contractors, the Blackwater USA subsidiary of the infamous former head of the firm now known as Xe Services, was fined $1 million by the U.S. Army. According to recent research, contractors engaged by the federal government are not under criminal investigation in Iraq and, even with fines, are still paid and viewed as trustworthy in Iraq. The researchers examined 33 federal contractors in Iraq and found none of the companies had been investigated for fraud or subcontractor theft. The researchers concluded the inability of government investigators to track down the perpetrators in Iraq made it likely that the government simply didn't care. John Shepherd and his co-authors, former project managers for the Army and private investigators, set out to track some of the federal contractors engaged in Iraq to see if problems existed. They created a questionnaire and distributed it to contractors engaged in reconstruction in Iraq, as well as to private investigators. The investigators concluded that there was a significant difference between the views of the contractors and the views of private
