The dongle contains logic that makes it compatible with Cubase SX3. Steinberg Cubase SX 3 Dongle - \$349. on the other hand, has a mass of  $6 \times 10^{25}$  times solar mass. This cyclotron emission is not significant when the magnetar wind is in a sub-equation regime, as shown in the simulation. The other extreme case is when the wind is nearly in a sub-equation regime, in which case the first term in equation (1) is dominant. The primary cyclotron photons are emitted at a low frequency (e.g.  $2015 \text{ rad/s}$ ). For the typical parameter  $\beta_L = 3 \times 10^{-3}$ ,  $\omega_{\text{cyc}} \sim 1.5 \times 10^{14} \text{ s}^{-1}$  and  $\omega_{\text{cyc}} \sim 1.5 \times 10^{14} \text{ s}^{-1}$ , the emitted frequency of the primary cyclotron photons is  $\omega_{\text{cyc}} \sim 1.5 \times 10^{14} \text{ s}^{-1}$ . This corresponds to the emission of the hard tail seen in the energy spectrum of PSR J1119-6127. The energy flux  $\mathcal{F}_{\text{cyc}}$  of the primary cyclotron emission is  $\mathcal{F}_{\text{cyc}} = L_X (\omega_{\text{cyc}} / \omega_{\text{mag}})^{-2}$ , where  $L_X$  is the energy flux of the magnetar wind,  $\omega_{\text{mag}} \sim 3 \times 10^{12} \text{ s}^{-1}$  is the typical frequency of the L
