The timing of daily news articles covered by Google was determined by adding the relative positivity and negativity scores of all articles by Google's Opinion Rewards project (left) to the viewability percentage for the articles' URL (right), according to a new study by the authors of the study. (Screenshot: adxg) The majority of Google News articles were covered by Google and had an impact on the emotional state of U.S. readers. However, most of the positive articles did not have a high percentage of viewability, whereas most of the negative articles did. The study, conducted by researchers from the Carlson School of Management at the University of Minnesota, used data from Google's internal Opinion Rewards program, which focuses on identifying high-quality news articles and stories and rewarding readers for high-value content. The study used Google's viewability data as well as the impact of articles and the level of participation. "Our study is the first to show that news articles covered by Google News have a positive emotional effect on the U.S. readers, even though many of the positive articles were not widely viewed," said Chunyi Song, the study's lead author and a doctoral candidate at the University of Minnesota. "Google Opinion Rewards provides the opportunity to identify and reward high-quality content that is, by its nature, difficult to access, and all articles have high-quality news sources," she continued. "Our work shows that this type of content is read, but not as much as we expect." The findings are published in the Proceedings of the National Academy of Sciences (PNAS). The paper highlights the use of Google Opinion Rewards to investigate public interest in stories covered by Google's News. The data was collected between July 2017 and November 2018. "We used a large sample of data from Google Opinion Rewards to measure the impact of news articles and the level of participation on emotional satisfaction," Song said. "We also used Google's viewability data to show which articles were read." The study was conducted in two phases. First, a modified experience sampling method was used to measure the content's impact on readers and their level of emotional satisfaction in seven-day intervals. Google's Opinion Rewards provided six hashtags associated with particular subjects. The respondents were asked to select a story about that subject from the articles covered by Google News and assign a rating to that story. A 16-question survey that was designed to determine the relationship between emotional satisfaction and content
