Scalable radical cyclization of heterobicyclic systems for the synthesis of cyclopenta[a]pyrans. A highly efficient and expedient radical addition/cyclization cascade of heterobicyclic (or fused) aryls with 3-halophenyl cations provides a convenient and useful route to diverse functionalized cyclopenta[a]pyrans. This transformation operates on a heterocyclic system with a high degree of facial selectivity (see also: Scheme 1). Revealed: Saturn's biggest moon, Enceladus, holds an ocean of ice - laurex ===== 0-\_0 > "The discovery of the ocean means there must be a liquid water reservoir > beneath the surface, he says, which may help explain why the moon is still > active." > "It probably explains why the geysers are working the way they are." But that's not convincing. One possible explanation is that the geysers are controlled by a naturally occurring electrical current, and that could easily be explained by electromagnetic effects (such as those caused by Jupiter breathing). ~~~ glenra If you listen to the audio at the beginning of the presentation linked to in the article, the presenter discusses some papers suggesting just that: the geysers may be caused by something as simple as Jupiter's radio waves pressuring the water, which results in water-ice molecules breaking up and reacting with themselves to emit radio waves. In which case there is no need to postulate some pretty sophisticated and sophisticated theories about "subsurface oceans" as the cause of the geysers. It also provides a possible way to check whether the hypotheses is correct or not: simply measure the radio waves emitted by the geysers. ~~~ blacksmith\_tb I haven't been able to find a more recent discussion of the current hypothesis, but there was a paper in 2012 [1] which was more than ten years old which saw an 'ocean'. (The paper is a bit disorganized and talks about anticyclones and swirls, but it's
