Adobe Photoshop Elements offers a wide range of features that range from auto-retouching to advanced photo retouching. Basic Elements Adobe Photoshop Elements has a large selection of basic features that make it suitable for new users. Some of these features include: Basic Photo Editing Basic Photo Editing Slideshow Creation Basic Photo Editing Video Editing Basic Photo Editing Basic Photo Editing is the foundation of Photoshop Elements, and has been designed to allow users who are new to the program to develop a good idea of how Photoshop operates. 1.1. Basic Adjustments Basic Adjustments Basic Adjustments allows you to adjust brightness, contrast, and other basic image adjustments. Before you begin, you need to know the difference between adjustment layers and adjustment profiles. Layers are grouped layers of an image and provide the user with the ability to edit multiple layers at once. Profiles are a group of settings that enable a user to configure a single image for a specific purpose. Here are a few of the most common adjustments to keep in mind: Brightness and Contrast This feature offers a high contrast range of +50 to -125 with a large range of colors. You can also change the default white balance using this function. Sharpen and Clarity This feature gives users the ability to sharpen and decrease digital clarity. Sharpening enables the user to more clearly delineate edges in their images. Clarity enables you to more clearly outline a subject against the background. Red-Eye Fix Red-Eye Fix uses the depth information in an image to automatically detect and remove the red eye of a user's eyes. Picture Effects This feature allows you to add certain effects to an image including adding a matte, drawing your own frames, adding a color filter to an image and much more. These effects can also be changed using Photoshop Elements' multiple settings and sliders. 1.2. Layers and Adjustment Layers Adjustment Layers Adjustment layers enable the user to manipulate individual, specific layers of a photo without affecting any of the other layers. Let 05a79ceeff

Q: How do I display a user's choices on a given page? I have a module that displays a set of images on every page. I also have an "Edit" link that brings the user to a page where they can see/edit the image for that particular page. How do I display each user's current image choices on that page? Pseudo-code: user_choices = ['img1', 'img2', 'img3'] if user == id: user_choices = ['img1', 'img2', 'img3']

A: I think that what you are asking for is the "wizard" type module. After digging a little bit I found this article and a few modules that seem to be active: The Center on Media, Data, and Social Networking's Mission The Center on Media, Data, and Social Networking (CMDASN) advances academic inquiry by promoting interdisciplinary and inter-institutional collaboration on the governance and implications of the massive growth and use of digital media and social networks. The center, established in 2010, reflects a new direction of social science scholarship, one that focuses on the social aspects of media technologies and applications, particularly as embodied in the online world of social networking, blogs, and mobile devices. The Center is based at the Ohio State University and is supported by a gift from the Howard T

Q: SQL Server - Post query to not-clustered index with huge table Let's say I have a table that has 15 GB of data and the data is constantly being inserted and/or updated. In order to keep my index size small, I create a non-clustered index on column X. But, when I add it to SQL Server Management Studio, it seems to fail. The error message is 'Table or view does not exist in the current database'. I guess it's because I am trying to add an index on such a huge table. Is there a workaround? A: Here is how I used to post-process a large table (15GB) to move it to a non-clustered index... /* declare @sql_stmt varchar(max) declare @table_name sysname select @sql_stmt = select ' ' + s.name + '[' + x.name + ']' from sys.indexes x inner join sys.index_columns ic on ic.[object_id] = x.[object_id] and ic.[column_id] = x.[column_id] inner join sys.index_columns icm on ic.[object_id] = icm.[object_id] and ic.[column_id] = icm.[column_id] inner join sys.indexes i on i.[object_id] = ic.[object_id] and i.[index_id] = ic.[index_id] and i.[name] = x.[name] where icm.index_id > 1 and ic.index_id = 1 and i.[object_id] = 'OBJECT_ID('dbo.table_name')' and i.name = 'X' select @table_name = s.name from sys.schemas s where s.schema_id = object_id('N'Dbo') --non-clustered indices ' and s.[type] = 'NU' and s.[name] not like 'X_%' select @sql_stmt = replace
