Mursaatkir Mursaatkir February 11, 2019. Shop Solid Edge for Professionals. Creating 2D and 3D Models with Solid Edge. Solid Edge is the world's leading 3D modeling solution, and the only true 2D and 3D. Event details Monday January 22, 2019 The Alsop Institute of Advanced Engineering and Technology (AIATE) will host its first regional opening of its Fit for the Future training Program, which provides computer science and engineering scholarships to minority middle-school students. The three-month program will focus on placement in well-paying STEM jobs in Texas. Texas is a leader in the aerospace, information technology, energy, bioscience, and medical device industries. As a leader in wind and solar energy, Texas also serves as a major center for energy efficiency and industrial efficiency. The Alsop Institute of Advanced Engineering and Technology, a nonprofit economic development corporation located in the Clear Lake area, will host the first regional FIT FOR THE FUTURE training for the Galveston-Houston-Galveston, Texas counties. The training focuses on placement in well-paying STEM jobs in Texas. Texas is a leader in the aerospace, information technology, energy, bioscience, and medical device industries. As a leader in wind and solar energy, Texas also serves as a major center for energy efficiency and industrial efficiency. Members of the Galveston-Houston-Galveston County area were chosen for the first regional program because of the shortage of entry level technical positions in the fields in the area, as well as the large pipeline of talent that is emerging from the local community. The training focuses on placement in well-paying STEM jobs in Texas. The regional session will place an emphasis on the aerospace, information technology, and bioscience industries. This location was chosen because the Houston-Galveston metropolitan area is home to many of the aerospace, information technology, and bioscience industries. AIATE's executive director, Don Crowe Jr., said, "With a booming economy, we're seeing an influx of skilled applicants to the field, but we also see a shortage of entry level positions." Crowe said the purpose of the program is to supply that shortage. "The students are being paired with great companies where they can learn hands-on skills, such as problem-solving and teamwork," Crowe said.

Cell migration is a critical element of many biological processes such as the migration of cells into tissues, wound healing, and development. However, existing mathematical models of cell migration are based on a continuum description of cells and neglect the impact of cell-cell interaction and cell heterogeneity. Here, we develop and validate a framework that simultaneously accounts for cell-cell interaction, individual heterogeneity, and stochasticity. We first present an individual-based model of a cell that exhibits a biased random walk. We then show how to include individual variations in cell-cell adhesion within a population. Lastly, we expand the model to include stochastic migration. We compare these results to an analytical model based on a continuum description and show that the individual-based model provides a significant improvement over the continuum model. We then test the spatial and temporal accuracy of the individual-based model on the same parameter space as the continuum model using both simulations and analytical predictions.Grass carp Rhombosolea opaca excretory system contains glutamate-sensitive K<sup>+</sup> channels. We studied the electrophysiological and pharmacological properties of efferent fibers in the excretory system of the northern grass carp (Rhombosolea opaca), a cyprinid fish possessing an extensive network of a void bladder. Single efferent fibers were recorded intracellularly in the efferent branches of the pelvic nerve that projects from the internal sac to the cystoliths and the seminal vesicles. Based on their characteristic response pattern to voltage-clamp depolarization, three types of efferent fibers were identified: neurite-bearing type (Nb type, n = 52), neurite-less type (NI type, n = 6), and neurite-laden type (NI type, n = 40). Type NI fibers were characterized by a rapid depolarization during the first dep
