Field of the Invention The present invention relates to a distance measuring device, in particular a vehicle distance measuring device for measuring the distance to a vehicle ahead, which has a radar element emitting a radio-frequency signal and a scan unit which comprises a radiation source for generating radiation, a receiving unit for receiving the reflected radio-frequency signal and a mirror for directing the radiation to the receiving unit, which is provided with devices for, in a receiving operation, adjusting the mirror angle with respect to an azimuth angle and with respect to an elevation angle, and which, in a measuring operation, receives the reflected radio-frequency signal having its polarization direction rotated at the mirror. 2. Description of the Related Art Radar systems are used in a wide variety of applications in vehicles. For example, radar systems are used for detecting objects in front and the distance to these objects, and for determining the position of a vehicle, while it is being driven, for example for controlling steering angle or engine speed. For example, a radar system is known from European Patent No. EP 0 756 578 B1 which has a periscope mirror with a geometrical shape which is arranged in front of the radiation source and the receiver. On the one hand, the periscope mirror serves to direct 6d1f23a050
