I tried to read the string after the " " and compare it with the string inside the table but i'm out of clues. A: Try this :

```
rgn = [r['name'],  
r['value']] for row in  
table_to_crack.findAll("div",  
{ "class": "data" }): if row.text  
== "Length:" and row.getEle  
mentsByTagName("td")[2].te  
xt.lower() in rgn: row.getEle  
mentsByTagName("td")[2].te  
xt = " " + row.getElementsB
```

yTagName("td")[2].text.lower()
r() Light levels and seasonal variability of nocturnal light emissions in a natural population of *Lacerta viridis*. Geothermal activity in the Pyrenees Mountains in the south-western Iberian Peninsula results in higher than expected light levels of the nocturnal environment. The emission of nocturnal light reflects lizard activity during the night, and thus, as some nocturnal predators are active at night,

influences the activity patterns of prey species. In this study, we used a simple method to quantify light emissions from natural populations of lizards and evaluated the potential impact of nocturnal light emission on the foraging activity of a natural lacertid prey species. Our results indicate that light at night is a significant energy for desert striped lizards, *Lacerta viridis*. Moreover, they also provide evidence of

light emission during spring and summer, suggesting that light could be a limiting factor for foraging during these seasons. Finally, we showed that the total nocturnal light produced by this natural population of *L. viridis* is similar to the total light produced by artificial light sources used for nighttime illumination.

```
let sample = new Array(3);
sample[0] = 'a'; sample[1] = 'b'; sample[2] = 'c'; let
```

```
sampleArray =  
sample.map(element =>  
element.toUpperCase()); //  
['A', 'B', 'C'] `` c6a93da74d
```
