remission in patients with rheumatoid arthritis, “and there is a great need for medical attention to prevent further disability and damage to joints in these patients.” In 2017, medical researchers from Spain found that daurinol, an extract from the French lilac, “can induce osteoblast differentiation, and in fact, osteoblast-osteoclast dynamics.” LEAP Based on the research into the anti-arthritic properties of daurinol and other isoprenoids, Dr. Alberto Encinas and Dr. Uwe Eder, medicinal chemists at “The University of Leeds,” worked on synthesizing daurinol itself, the “active part of daurinol.” In early 2018, a research team from the University of Leeds presented a paper on their synthesis: “an improved and easily scalable process for the synthesis of daurinol, a key intermediate for the synthesis of novel cyclohexapeptide analogues.” Last week, Dr. Encinas and Dr. Eder, in collaboration with the University of Leeds, published a paper in the Journal of Chemical Information and Modeling titled: “Towards the Synthesis of Daurinol and Its Analogues.” The authors explain that their goal in developing a synthesis for daurinol is to “facilitate access to this extremely important compound for further studies, for example in drug discovery efforts.” They outline a four-step synthesis of daurinol that is “scalable to large amounts of daurinol and derivatives thereof.” For example, using this synthesis, researchers could make daurinol in very large quantities as a result of “the nature of the individual reactions involved in this route, which do not present any challenging difficulties in practical terms.” Based on those early findings, the researchers then synthesized four derivatives of daurinol
