Free Video Learning To Go. 595x558 px - 1.47MB..

Mesnevia Na Bosanskom Pdf Download.A polycrystalline diamond (PCD) is formed by sintering diamond grains into a coherent mass by means of a high pressure high temperature (HPHT) process. The HPHT process typically requires very high temperatures and pressures for the diamond grains to sinter and merge into a single mass. The process causes the diamond grains to bond together by forming covalent bonds between diamond atoms of the diamond grains as well as forming the interstices of the polycrystalline diamond mass. The process of forming the interstices includes a liquid-state bonding process and a solid-state bonding process. The diamond grains used in the HPHT process for forming a PCD are normally formed of a synthetic diamond material or natural diamond material. When forming PCD with synthetic diamond grains, synthetic diamond grains are used and formed into an ultra-fine powder, i.e. a nano-grain size, and then the ultra-fine diamond powder is sintered in the HPHT process for forming PCD. When forming PCD with natural diamond grains, a natural diamond material is used as a powder and then the natural diamond powder is sintered in the HPHT process for forming c6a93da74d
