There are so many different types of tools that it's impossible to list them all. Among those must-have tools include Text, Layers, Smart Objects, Content-Aware Fill, Spot Healing Brush, Content-Aware Move, and Meld tools. I don't want to overstretch the ability of so important a program to list every amazing feature out there, but a few more examples should provide a better sense of how Photoshop has evolved and continued to innovate. Although Photoshop is a serious editing tool, it's also great for just creating images. This version includes advanced system-layer tools, in-accurate smart objects, and superior brushes. In the past, the brushes were a tad limited. This version is far better than when it first came out. Of course, you can always change to the older, simpler version. Photoshop is the most complex application consumer-grade editors have ever seen. The most basic functions work on all platforms. The sequence of actions between tools is familiar on all platforms. So, even though the user interface obviously differs from machine to machine, it's clear everything works the same, and that should satisfy most people.

Greater editing power. Photoshop for Web, a new desktop application targeted to the traditionally challenging workflows of creating, integrating and editing design projects for the web, brings new features to Adobe's award-winning Photoshop editors. You can now edit Final Cut Pro (FCP) or Avid.mov files directly from the desktop version. And a new one-click Delete and Fill tool replaces the time-consuming, labor intensive and often infuriating Create A Better Outline tool. The new Delete and Fill tool is an atomic operation, one step that undoes everything that has already been done to the image, including fill and stroke, clipping, transforms, paths and channels, and mask layers. It's like putting your wine back with the cork, without having to try and figure out which cork came with it. Finally, the new Delete and Fill functionality is available when you use layers as selection or mask layers. This is an unprecedented and groundbreaking addition to the editor. It also enables you to realize the full potential of intelligent selection tools like the Content Aware Move tool. The new Web features of Photoshop for Web are incorporated into the Mac and Windows desktop versions of the award-winning tools, so you can seamlessly edit multi-project workflows across any platform. In addition, the new features are not just limited to graphic editing. For example, if you edit raw photos using Adobe Lightroom, the new Web features will let you save in the camera format that you use with that software.

The other exciting thing about Photoshop 2020 is that they've added a new content-aware tool called Warp Mask. This tool makes it possible to remove large objects (say, an elephant or an entire background) from an image as well as warp and distort those objects. The new content aware tool works really well, as long as your subject is mostly still. Elsewhere you can use the following features in Photoshop 2020: -The Face Creator tool, which employs Deep Face Recognition technology. Face Creator does not replace Photoshop's Face Replacement, but replaces it as a two-step process with Face Creator first, then Face Replacement second. You can outfit a face with just a few clicks. -The new Simple Shadows tool. This tool makes it easy to make subtle changes to existing layers. Apart from Shadows you can also use the Gradient Editor tool with the Shape Options to quickly draw and fill in areas of a photo. This is a great tool for isolating your subject from the background to simplify things. -The Graphics Generator tool, which is useful for creating new graphics in Photoshop. It's very basic, but you can also use Paths and type tools to create new VR content. This is a great tool to use if you're short on ideas or just can't think of them. -Call to Action (CTA) layers. These are useful for creating promotional content, which can be put on social media or email filters, or you can export the layers for use on your website. CTA layers are embedded with the necessary text and images so that you can easily add them into shop pages and beyond from places like MailChimp and Wix.

Of course, all this takes time. So, while Adobe is urging you not to panic and helps users transition to the new hardware, it will take time for users to transition to the new software. Tools from the likes of Adobe, Apple, and third-parties may be required. That's a best case scenario. In a worst-case scenario, or if users aren't able to take advantage of the native GPU features available to

these updates, applications like Elements may still be faster, depending on your particular workflow. And at that time, Elements may become the go-to application for the batch processing of images. Elements has the ability to instantly perform effects, such as recoloring and retouching, in bulk. Or perhaps even cheaper, are applications like Photoshop Express Premium, provided by Adobe's Aggressive Pricing (\$20 for the editor's 10, 50, 100, 250, 500, 1000, 2500) or Photoshop Express (\$9.99/year, or \$30 for three years). Both applications perform many of the features of Photoshop in a simplified way, but they lack the professional level tools of the full Photoshop. Ah, but would that be so bad? While it wasn't as speedy as its older iteration, Elements seems to be the pick of the pack. If you just want to process a few images quickly, you may find that you have no other choice than Photoshop. If, however, there's a need to process your images in a sophisticated way, prepare for the transition. Adobe Photoshop is the most popular Graphics Editor in the world.
